Introduction and motivations

The standard model

- The standard model (SM) of particle physics describes many experimental results that probe the interactions between elementary particles.

The standard model

- The standard model (SM) of particle physics describes many experimental results that probe the interactions between elementary particles.
- In the SM, the building blocks of matter are the fermions, which are comprised of quarks and leptons.

The standard model

- The standard model (SM) of particle physics describes many experimental results that probe the interactions between elementary particles.
- In the SM, the building blocks of matter are the fermions, which are comprised of quarks and leptons.
- The interactions are mediated through the exchange of force carriers: the photon, the W and Z bosons, and the gluons.

The standard model

- The standard model (SM) of particle physics describes many experimental results that probe the interactions between elementary particles.
- In the SM, the building blocks of matter are the fermions, which are comprised of quarks and leptons.
- The interactions are mediated through the exchange of force carriers: the photon, the W and Z bosons, and the gluons.
- All the elementary particles acquire mass through their interaction with the **Higgs field**.

Standard Model of Elementary Particles

The discovery of the Higgs boson

- The SM doesn't predict the value of the masses of the elementary particles, including the Higgs boson mass.

The discovery of the Higgs boson

- The SM doesn't predict the value of the masses of the elementary particles, including the Higgs boson mass.
- The particles masses are considered parameters to be determined experimentally.

The discovery of the Higgs boson

- The SM doesn't predict the value of the masses of the elementary particles, including the Higgs boson mass.
- The particles masses are considered parameters to be determined experimentally.
- The range of possible values for the Higgs boson are all below the 1 TeV.

The discovery of the Higgs boson

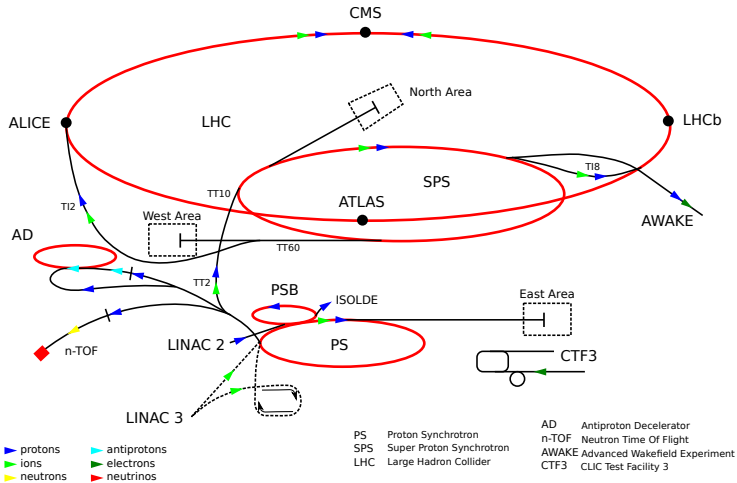

- The SM doesn't predict the value of the masses of the elementary particles, including the Higgs boson mass.
- The particles masses are considered parameters to be determined experimentally.
- The range of possible values for the Higgs boson are all below the 1 TeV.
- The data taken from the LEP and SLC colliders, the Tevatron, and other experiments predicted the Higgs boson mass in the range 90 GeV – 152 GeV at the 95% confidence level (CL).

- Furthermore, other searches at LEP excluded values lower than 114.4 GeV at 95% CL, and measurements at Tevatron excluded mass range 162 GeV – 166 GeV at 95% CL.

- Furthermore, other searches at LEP excluded values lower than 114.4 GeV at 95% CL, and measurements at Tevatron excluded mass range 162 GeV – 166 GeV at 95% CL.
- The discovery of the SM Higgs boson is one of the primary scientific goals of the LHC.

- Furthermore, other searches at LEP excluded values lower than 114.4 GeV at 95% CL, and measurements at Tevatron excluded mass range 162 GeV – 166 GeV at 95% CL.
- The discovery of the SM Higgs boson is one of the primary scientific goals of the LHC.
- The CMS experiment excluded at 95% CL masses from 127 to 600 GeV. The ATLAS experiment excluded also at 95% CL masses in the ranges 111.4 – 116.4, 119.4 – 122.1, and 129.2 – 541 GeV.

- Furthermore, other searches at LEP excluded values lower than 114.4 GeV at 95% CL, and measurements at Tevatron excluded mass range 162 GeV – 166 GeV at 95% CL.
- The discovery of the SM Higgs boson is one of the primary scientific goals of the LHC.
- The CMS experiment excluded at 95% CL masses from 127 to 600 GeV. The ATLAS experiment excluded also at 95% CL masses in the ranges 111.4 – 116.4, 119.4 – 122.1, and 129.2 – 541 GeV.
- In 2012, the ATLAS and CMS collaborations reported an excess of events between 2σ and 3σ near 125 GeV.

- The final result was the observation by the ATLAS and CMS collaborations of a new heavy boson with a mass of approximately 125 GeV.

- The final result was the observation by the ATLAS and CMS collaborations of a new heavy boson with a mass of approximately 125 GeV.
- In particular, the CMS publication focused on the observation in five decay channels in the low-mass range from 110 to 145 GeV.

- The final result was the observation by the ATLAS and CMS collaborations of a new heavy boson with a mass of approximately 125 GeV.
- In particular, the CMS publication focused on the observation in five decay channels in the low-mass range from 110 to 145 GeV.
- This decay channels correspond to: $H \rightarrow \gamma\gamma$, $H \rightarrow ZZ \rightarrow 4l$, $H \rightarrow WW \rightarrow l\nu l\nu$, $H \rightarrow \tau\tau$, and $H \rightarrow bb$, where l stand for e^- and μ^- .

- In particular, the CMS publication focused on the observation in five decay channels in the low-mass range from 110 to 145 GeV.
- This decay channels correspond to: $H \rightarrow \gamma\gamma$, $H \rightarrow ZZ \rightarrow 4l$, $H \rightarrow WW \rightarrow l\nu l\nu$, $H \rightarrow \tau\tau$, and $H \rightarrow bb$, where l stand for e^- and μ^- .
- The channels with the highest sensitivity for discovering the SM Higgs boson with a mass near 125 GeV are $H \rightarrow \gamma\gamma$ and $H \rightarrow ZZ \rightarrow 4l$.

Theoretical framework

- ROOT is an object-oriented C++ framework aimed at solving the data analysis challenges of high-energy physics.

- ROOT is an object-oriented C++ framework aimed at solving the data analysis challenges of high-energy physics.
- ROOT was developed in the context of the NA49 experiment at CERN in the 90s, where this experiment has generated an impressive amount of data, around 10 Terabytes per run.

- ROOT is an object-oriented C++ framework aimed at solving the data analysis challenges of high-energy physics.
- ROOT was developed in the context of the NA49 experiment at CERN in the 90s, where this experiment has generated an impressive amount of data, around 10 Terabytes per run.
- The ROOT framework has a lot of libraries which contains several classes.

- Among the libraries we have AlpGen, MadGraph, PowHeg, FastJet and ROOT.

- Specifically, PYTHIA is a general-purpose event generator for high-energy particle collision, rewritten from scratch in C++.
- PYTHIA can be run standalone, but it can also interfaced with a set of other libraries.
- Among the libraries we have AlpGen, MadGraph, PowHeg, FastJet and ROOT.
- For this project we are interested only in ROOT.

A simple PYTHIA algorithm

Let's make a simple PYTHIA algorithm. Indeed, go to the directory

```
1 > cd pythia8303/examples
```

In such directory, create the file mymain01.cc. Once the file is created, modify the Makefile located in the same directory:

```
1 # ROOT (turn off all warnings for readability).
2 mymain01: $(PYTHIA) $$@.cc
3 ifeq ($(ROOT_USE),true)
4     $(CXX) $$@.cc -o $$@ -w $(CXX_COMMON) $(ROOT_LIB
5         )\
6         '$(ROOT_CONFIG) --cflags --glibs '
7 else
8     $(error Error: $$@ requires ROOT)
9 endif
```

Now, in the file mymain01.cc add the following lines of code:

```
1 Pythia pythia;  
2 pythia.readString("HiggsSM:all = on");  
3 pythia.readString("Beams:eCM = 13000.");  
4 pythia.readString("Next:numberShowEvent = 2");  
5 pythia.init();
```

```
1  for (int iEvent = 0; iEvent < number_of_events; ++  
    iEvent)  
2  {  
3      pythia.next();  
4      Int_t ie = 0;  
5      for (Int_t i = 0; i < pythia.event.size(); ++i)  
6      {  
7          if (pythia.event[i].id() == 11)  
8          {  
9              ie = i;  
10             m_e_histogram -> Fill(pythia.event[ie].m()  
11             );  
12         }  
13     }
```

```
1  for (int iEvent = 0; iEvent < number_of_events; ++  
    iEvent)  
2  {  
3      pythia.next();  
4      Int_t imu = 0;  
5      for (Int_t i = 0; i < pythia.event.size(); ++i)  
6      {  
7          else if (pythia.event[i].id() == 13)  
8          {  
9              imu = i;  
10             m_mu_histogram -> Fill(pythia.event[imu].m());  
11         }  
12     }  
13 }
```

Finally, to compile the algorithm write the following commands in the terminal shell

```
1 > make mymain01
2 ./mymain01 > myout01
```

This will generate the following output:

```

Results

A simple analysis of the Higgs

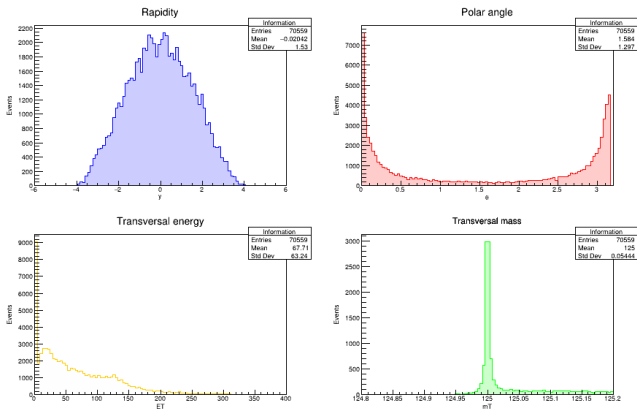

- Before to show the main analysis of this project let's study in first place the kinematical variables associated with the Higgs boson.

A simple analysis of the Higgs

- Before to show the main analysis of this project let's study in first place the kinematical variables associated with the Higgs boson.
- Indeed, the histogram for the variables p_T , η , ϕ and E have the form

- Furthermore, the histogram for the variables y , θ , E_T and m_T have the form

- On the other hand, the mass of the Higgs boson have the following distribution:

- Finally, the production of the Higgs boson due to the processes $f\bar{f} \rightarrow H^0$, $gg \rightarrow H^0$, $\gamma\gamma \rightarrow H^0$, $f\bar{f} \rightarrow H^0 Z^0$, $f\bar{f} \rightarrow H^0 W^\pm$, $f f' \rightarrow H^0 f f'$, $f_1 f_2 \rightarrow H^0 f_3 f_4$, $gg \rightarrow H^0 t\bar{t}$ and $q\bar{q} \rightarrow H^0 t\bar{t}$ is shown in the stacked mass histogram

- In the $H \rightarrow \gamma\gamma$ channel we made a search of the diphoton mass $m_{\gamma\gamma}$ in the range 110 – 150 GeV.

- In the $H \rightarrow \gamma\gamma$ channel we made a search of the diphoton mass $m_{\gamma\gamma}$ in the range 110 – 150 GeV.
- The diphoton mass receive contributions from a large irreducible background from quantum chromodynamics.

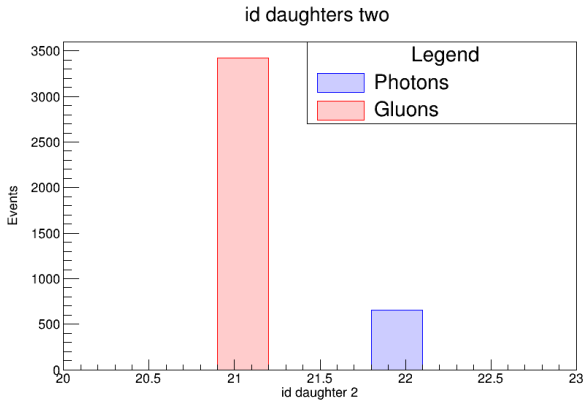

- In the $H \rightarrow \gamma\gamma$ channel we made a search of the diphoton mass $m_{\gamma\gamma}$ in the range 110 – 150 GeV.
- The diphoton mass receive contributions from a large irreducible background from quantum chromodynamics.
- The channel $H \rightarrow \gamma\gamma$ is one of the most promising channels in the search of the SM Higgs boson in low mass range.

- Now, let's try to reconstruct the SM Higgs boson in the $H \rightarrow \gamma\gamma$ channel. Indeed, the distribution of the masses of the all possible daughter (according to PYTHIA) of the SM Higgs boson is

- From the above histogram, we see that the majority of the events corresponds to daughter that are massless. Indeed, by doing a histogram of the ID of the daughters that are massless we get

- From above we see that we have daughters that correspond to photons and gluons. However, we are interested only on the photon daughters.

- From above we see that we have daughters that correspond to photons and gluons. However, we are interested only on the photon daughters.
- In this way, by using the formula

$$m_{\gamma\gamma} = \sqrt{2p_{T,1}p_{T,2} (\cosh(\eta_1 - \eta_2) - \cos(\phi_1 - \phi_2))}, \quad (1)$$

we get the following histogram for the diphoton mass:

$$H \rightarrow c\bar{c}$$

- When the Higgs boson was discovered, this particle was measured in the decay channel $\gamma\gamma$, ZZ , WW and $\tau\tau$.

$$H \rightarrow c\bar{c}$$

- When the Higgs boson was discovered, this particle was measured in the decay channel $\gamma\gamma$, ZZ , WW and $\tau\tau$.
- However, one of the highest priorities of the LHC is the measurement of the coupling of the H boson with other SM particles.

- When the Higgs boson was discovered, this particle was measured in the decay channel $\gamma\gamma$, ZZ , WW and $\tau\tau$.
- However, one of the highest priorities of the LHC is the measurement of the coupling of the H boson with other SM particles.
- Recently, ATLAS and CMS reported the coupling of the H boson with the quarks t and b .

- When the Higgs boson was discovered, this particle was measured in the decay channel $\gamma\gamma$, ZZ , WW and $\tau\tau$.
- However, one of the highest priorities of the LHC is the measurement of the coupling of the H boson with other SM particles.
- Recently, ATLAS and CMS reported the coupling of the H boson with the quarks t and b .
- Thus, the next objective is the measurement of the coupling of H with second generation quarks (c and s).

- Now, let's analyse the decay $H \rightarrow c\bar{c}$ by using the PYTHIA simulator. Indeed, again we have that the mass of the possible daughters are distributed according to the following histogram:

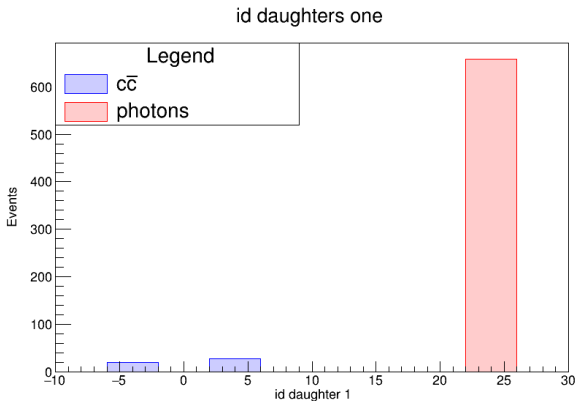

- From the previous histogram we have that there is a very low production of daughters between the mass range $1 - 1.5 \text{ GeV}$, where the charm quark is located.

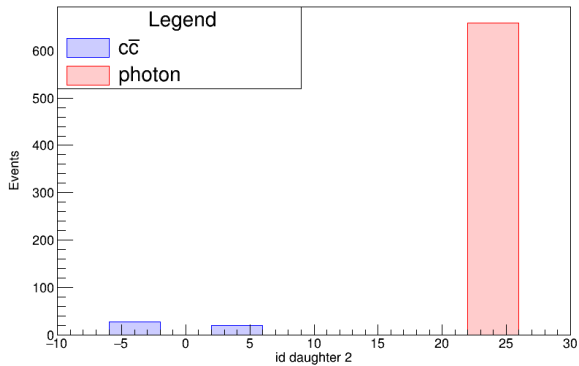

- From the previous histogram we have that there is a very low production of daughters between the mass range $1 - 1.5 \text{ GeV}$, where the charm quark is located.
- This is expected, because the branching fraction for the decay $H \rightarrow c\bar{c}$ is $0.0288^{+0.0016}_{-0.0006}$. This says that the coupling of the Higgs to the quarks $c\bar{c}$ is very weak.

- From the previous histogram we have that there is a very low production of daughters between the mass range $1 - 1.5$ GeV, where the charm quark is located.
- This is expected, because the branching fraction for the decay $H \rightarrow c\bar{c}$ is $0.0288^{+0.0016}_{-0.0006}$. This says that the coupling of the Higgs to the quarks $c\bar{c}$ is very weak.
- Indeed, the coupling of the Higgs with the third generation quarks $b\bar{b}$ is much strong.

- In this way, by making a histogram with the ID of the produced charm quarks we get

id daughters two

- Finally, by using the center-of-mass formula for a 2-body decay process

$$M = \sqrt{m_1^2 + m_2^2 + 2(E_1 E_2 - \vec{p}_1 \cdot \vec{p}_2)}, \quad (2)$$

we get the following histogram

Conclusions and remarks

- In this project we have tackled the problem of analyse the decay channels $H \rightarrow \gamma\gamma$ and $H \rightarrow c\bar{c}$.

- In this project we have tackled the problem of analyse the decay channels $H \rightarrow \gamma\gamma$ and $H \rightarrow c\bar{c}$.
- In particular, we have reconstructed the SM Higgs mass in these two decays channel, obtaining a resonance around the mass $m \sim 125$ GeV.

- In this project we have tackled the problem of analyse the decay channels $H \rightarrow \gamma\gamma$ and $H \rightarrow c\bar{c}$.
- In particular, we have reconstructed the SM Higgs mass in these two decays channel, obtaining a resonance around the mass $m \sim 125$ GeV.
- From the previous results we can conclude that the coupling with the second generation quarks is much weaker than the coupling with the photons.

- In particular, we have reconstructed the SM Higgs mass in these two decays channel, obtaining a resonance around the mass $m \sim 125$ GeV.
- From the previous results we can conclude that the coupling with the second generation quarks is much weaker than the coupling with the photons.
- The simulations were made with 10000 pp collisions. However, we can go further with more collisions by using computational clusters (e.g. LXPLUS).

Acknowledgments

I would like to thanks to the professors Edson Carquin and Juan Manuel Flores for the very enlightening lectures on Computational Physics imparted during this semester. This work is supported by Beca Interna del programa de doctorado de la Universidad Técnica Federico Santa María.

The references for this work can be finded in the project document.

Muchas gracias por la atención!
